Porto for Ecommerce

Features:

1. Email service for confirming email address (request verification email from your account management) and password reset.

2. All Entities listing supports paging and filtering and search using Ajax calls.

3. Orders system:

- Customer choices are stored in their cart in their local cookies and are forwarded to server when they checkout.
- Customers can place orders on products, and can assign different payment method for each product, after that, they can keep track of the order status (pending, shipped, delivered, rejected) and cancel their orders if not shipped yet.
- Vendors receive those orders and can keep track and update the orders' status per product per customer.
- Admins can oversee all the transactions that are taking place on the website.

4. Requests System:

- Customers can request a vendor role for their account, when registering.
- Vendors can request to add a new category in the website, when adding a new product.
- Admins can review those requests, and approve them or reject, and the actions will take place.

5. User Management:

- Admins can change (add or remove) roles to the users.

6. API support for two entities:

- Requests at /api/requests
- Orders at /api/transactions
- Get your token from: /token

7. with swagger documentation at /swaager
